

Intro to MRI for Neurology

Renee B. Van Stavern, MD
Neurology
Stroke Center

MRI

- Uses magnetic field and radio-frequency of water and fat hydrogen protons
- Does not use radiation
- Multiplanar
- Imaging depends on intrinsic signal of tissue - Multimodal
- Dark on all sequences:
 - ◆ Air, dense bone, metal
- Terms –
 - ◆ Hyperintense (bright)
 - ◆ Hypointense (dark)

Transverse
("Axial")

Coronal

Sagittal

T1-Weighted Image

Dark on T1
(Low signal)

- ◆ Air
- ◆ Calcium

Gray on T1 (long T1)

- ◆ Edema
- ◆ Most lesions
- ◆ Brain

- ◆ CSF

Bright on T1
(High signal, short T1)

- ◆ Blood (sometimes)
- ◆ Fat
- ◆ Gadolinium (Gd contrast)

T1-Weighted Image

■ Purposes

- ◆ Useful for anatomy
- ◆ Not very sensitive to lesions
- ◆ Pre-contrast image

T1-Weighted Image - hemorrhage

CT (day 1)

T1 (day 2)

T2 (day 2)

T1-Weighted Image - hemorrhage

CT (day 16)

T1 (day 20)

T2 (day 20)

T1 Image – Recognition

- Multiple orientations
- Looks like CT
- CSF black
- Cranium bright
- Orbits bright / globe black
- Distinguish from T1 with contrast (Gd)

T1-Weighted Image with Contrast

666

T1-Weighted Image with Contrast

Visualization of Blood Vessels
Enhancement of lesions with BBB
breakdown, esp. tumors

T2-Weighted Image

Black on T2
(Low proton signal)

- Bone
- Calcium
- Air
- Flow

Grey on T2
(Short T2)

- Brain
- Fat

Bright on T2
(Long T2 – footnote 1)

- Edema
- Most lesions
- CSF

T2-Weighted Image

- Purposes
 - ◆ Pathologic evaluation
 - ◆ Very sensitive for edema
 - ◆ Can't distinguish CSF
- Recognition
 - ◆ CSF / sulci - bright
 - ◆ Cranium, fat - bright
 - ◆ Eyes - bright
 - ◆ Brain tissue - neutral gray
 - ◆ Abnormal tissue - bright
- Appearance of Blood
 - ◆ Hyperacute - bright
 - ◆ Acute - very dark
 - ◆ Subacute - bright
 - ◆ Chronic - dark

T1-Weighted Image

T2-Weighted Image

Ghostoid appearance
Rebecca Chancey sez
Northern Lights – J. Sanchez

C-Spine MRI

FLAIR

FLuid Attenuated Inversion Recovery

T2

FLAIR

- Form of T2-weighted image, with free water suppressed
- Pathologic evaluation
 - ◆ Non-hemorrhagic, vasogenic or cytotoxic edema
- Sometimes improves gray/white distinction

FLAIR - Recognition

FLuid Attenuated Inversion Recovery

- Cranium barely visible
- CSF suppressed - dark
- Pathology – bright
- Often bright around lateral ventricles

Hemorrhage

CT (day 1)

T1 (day 2)

T2 (day 2)

T2* (T2-star)

T2* Sequence (“T2-star”)

- Susceptible to iron and calcium (*decreased* signal)
- Purpose
 - ◆ Evaluation of acute or chronic hemorrhage

T2* Recognition

- Like T2:
 - ◆ CSF bright; brain gray
- No cranium
- Susceptibility artifacts – dark near frontal, temporal bones
- Dark near blood or calcium

Diffusion-weighted imaging (DWI)

- Bright signal = restricted diffusion
- Specific Features
 - ◆ Random motion / CSF
 - ◆ Dark
 - ◆ Restricted motion
 - ◆ Bright
- Uses
 - ◆ Early recognition of ischemia
 - ◆ May also show abscess
- Recognition
 - ◆ Look for “DWI”, “b=1000T” or “b=900T” at bottom
 - ◆ Sometimes grouped with other images (such as b=1000P)

DWI

FLAIR

ADC MAP

ADC map (apparent diffusion coefficient)

Restricted diffusion = abnormal = black

Use *only* to verify DWI results

ADC
